

Abstract of the Disclosure

A spacer is provided that is configured to be secured to a panel. The spacer has a first piece having a generally tubular body portion of a preselected height,  $H_1$  with a first end and a second end. The second end has a preselected included angle,  $\theta$  with respect to an axis. The spacer has a second piece having a first end, an annular ridge which is located adjacent to the first end and a flange which is located adjacent to the annular ridge that extends radially outwardly from the axis. The first end of the second piece has a preselected height,  $H_3$ , a preselected included angle,  $\theta$  with respect to the axis and a seat which is adapted to receive the head of a fastener. The second end of the first piece is sandwiched between the first end of the second piece and the annular ridge.
